

Ensure safety compliance with a One Standard

Based on the risk assessment, we design the solution that ensures the optimum level of safety. The recommendation is so specific, it can be used as a requirements specification for all locations in your company. We call it "One Standard", and this makes it easy to establish the same safety standard everywhere.

Why is a "One Standard" important?

The purpose of a One Standard is to ensure that the company complies with both DS/EN15154, the guidelines from the Danish Working Environment Authority, and internal procedures regarding safety and first aid products (with a particular focus on emergency showers for the body, face and eyes).

The One Standard contains information about **installation, maintenance** and **operations** of the specific products and safety solutions chosen by the company.

Additionally, the standard will apply if new products are selected, new procedures are implemented, or if changes occur that lead to a revised risk assessment. The risk assessment may concern exposure to chemical damage (acid/base), burns, scalding, or large amounts of dust and/or particles, etc.
